

What changed in the mockup after reading the consultant's document

Summary of what the consultant proposed, the decisions we made, what was implemented in the mockup, where we deliberately diverge, and what's still open.

Mockup version
v2 · commit 7a0e3eb (main)

Scope
Mockup only; the backend is built by the dev team

01 Executive summary

The consultant didn't hand us a closed spec: he gave us a skeleton of requirements with open questions, a pickup mockup, and KPI tables that are still a draft. We used it as a guide to complete the flow we were missing.

What he proposed

- Logistics in 3 legs: **First Mile** (pickup), **Mid Mile** (warehouse and bus) and **Last Mile** (delivery).
- 4 support functions: Control Tower, Audit/Reconciliation, Finance and Infrastructure.
- For each actor: what they expect from the app and how their performance is measured on a dashboard.
- Leak-prevention: "1/x" labels, successful inbound scan, and batch reconciliation.

What we did

- The flow grew from **8 to 11 states**, with dispatcher acceptance and a destination leg.
- Last mile** with two modalities: delivered by the operator, or picked up by the recipient.
- The pickup driver **can adjust the package count** and reprint labels; a signature stays mandatory.
- Bus assignment with a **timetable suggestion** and a 2-hour window.
- 3 new or expanded roles**: Control Tower, Audit and Finance, plus onboarding (Konnect and KAM).
- 9 KPIs** computed from the event log.

Status of each gap versus the consultant

AREA	STATUS	COMMENT
Pickup and destination flow	Done	Acceptance, count adjustment, destination warehouse inbound, last mile and pickup.
Bus 2-hour rule	Done	Timetable suggestion, risk alert and measured compliance.
Roles and onboarding	Done	Control Tower, Audit, Finance, merchant registration by the KAM, and operator import from Konnect.
KPIs	Done	Computed client-side; the consultant's formulas have two errors we documented.
QR/DataMatrix labels and a real printer	Partial	We simulate the printer and use Code 39; a real QR is backend work.
Real-time GPS	Open	The integration is pending on the business side; the map is a schematic.
Third parties for last mile	Out of scope	Decision: left out for now.
Billing and pricing	On hold	Finance is read-only and shows no prices.

02 What the consultant said

The PDF has 12 pages. Pages 1, 7, 9 and 11 are just section titles; page 10 (scan nomenclature) and page 12 (flow diagram) are empty: **they are deliverables the consultant expects from us.**

Actors and what he expects from each

ACTOR	WHAT THEY EXPECT FROM THE APP	HOW IT'S MEASURED
Merchant	Self-service onboarding (to scale), order creation, tracking and history.	—
Logistics coordinator	Daily visibility: orders by postal code, live, pending, and real-time pickup tracking.	SSP (successful pickups)
Dispatcher	Onboarding, several fleets (contract, cost, driver), setting themselves active/inactive, and accepting assigned orders.	SSP, PTAT, acceptance rate, adherence
Pickup driver	Portable printer connected to the phone; each label with "1/x, 2/x..."; merchant signature.	Successful inbound (anti-theft in transit)
Warehouse (Mid Mile)	Inbound, staging and outbound. Today only inbound is scanned.	(undefined)
Bus crew	Loading scan. No scan on unloading.	—
Reconciliation	Matching master-order (MPO) batches and locating lost shipments.	MPO compliance

KPIs he defined (draft)

KPI	CONSULTANT'S FORMULA
SSP	Orders picked up ÷ orders received or assigned (per day)
PTAT	Time between assignment and warehouse delivery
Acceptance	Orders accepted ÷ orders assigned by the coordinator
Pickup Adherence	Boxes picked up ÷ boxes that should have been picked up
Successful Inbound	Inbound scans ÷ boxes picked up
Service level	$R = \text{actual time} \div \text{promised time}$; orders with $R \leq 1$ ÷ total
CPS	Shipments ÷ daily vehicle cost (pickup and delivery)
MPO compliance	Batches delivered ÷ batches picked up

Three things to correct in his document: (1) CPS is inverted: "shipments ÷ cost" is shipments per dollar spent, not cost per shipment; (2) the service level uses $R < 1$ and $R \leq 1$ in different places; (3) "MPO" is never defined (we assume master purchase order, which groups batches).

Excluded for now, per the consultant himself: route planning, staging and warehouse-outbound scans, bus-unloading scan, and warehouse tracking (left as "scope of improvement").

03 Decisions made

Answers to the consultant's 5 questions

QUESTION	ANSWER	WHAT IT MEANS FOR THE SYSTEM
1. Geography	Cities or provinces; also postal code.	City as the primary key; postal code optional on warehouses.
2. GPS	Yes, the integration still needs to be finished.	Still open; the map is a schematic.
3. Warehouse → bus	Must be en route within 2 hours of being assigned.	2-hour window with an alert (see the bus decision).
4. From the bus to the client	The same operator does first, mid and last mile, warehouse to warehouse; also pickup at an operator location; third parties as a personal idea.	Two last-mile modalities; third parties out.
5. Client refuses the delivery	Assumed infrequent.	No dedicated flow for now (open item).

Correction pending with the consultant: answer 5 said "each individual *winery*." We meant *warehouse* (in Spanish, "bodega" means both, and the consultant might think our clients are vineyards).

Later decisions

TOPIC	DECISION
Last mile	Options 1 (delivered by the operator) and 2 (recipient pickup) are implemented. Third parties are left out.
Package count	The pickup driver can change the count and print new labels. The merchant's or receiver's signature is mandatory at pickup. <i>(This reverses the earlier proposal that they could only file an incident.)</i>
Bus	Manual assignment by the warehouse worker, plus a suggestion of the next service from the operator's timetable. If it departs more than 2 hours after assignment, it's flagged as risk.
Service timetable	It's the assigned operator's own list of services.
Roles	Control Tower inside the Coordinator; an Audit/Reconciliation role; a read-only master Finance role.
Operator onboarding	Done by Kargo: a prefetch from Konnect (buses, services and crew come from its database).
Merchant onboarding	Done by the KAM, inside the Coordinator's view.

Interpretation we made: the message about the count adjustment said "at destination"; we applied it at **pickup (origin)**, which is where the driver receives the packages and where we require the signature. Let us know if you meant something else.

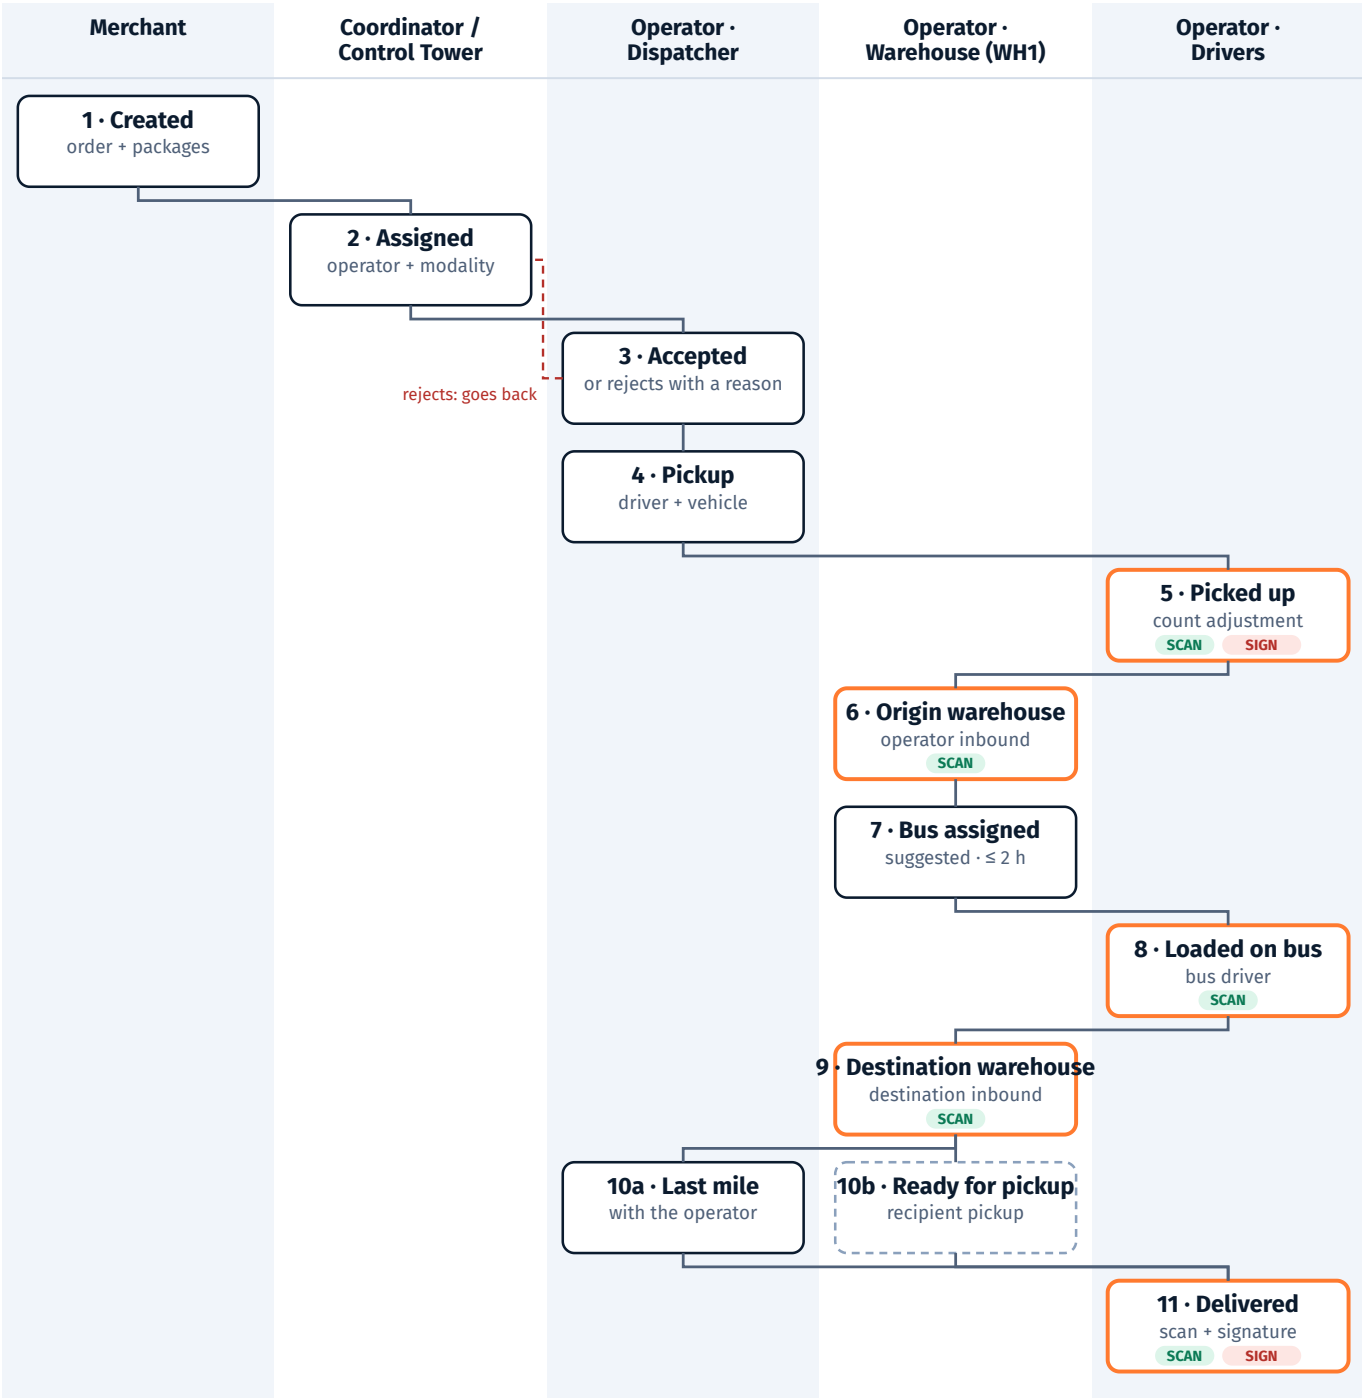

04 Gaps: how each one stands

The "what's missing on our side" list we put together after reading the PDF, with the result and where to see it in the mockup.

GAP	STATUS	HOW IT STANDS / WHERE TO SEE IT
Dispatcher acceptance	Done	Patricia (Dispatcher) sees <i>Accept order</i> and <i>Reject</i> (with a reason); a rejection sends the order back to the coordinator. Order ot_00008.
Pickup with count	Done	Héctor can add packages or mark one "not picked up" with a reason; new labels are printed and a count difference with an incident is left. Order ot_00007.
Merchant signature at pickup	Done	Still mandatory: authorized person, verified RUT and signature.
Leg from the bus to destination	Done	New states: destination-warehouse inbound, last mile assigned, or ready for pickup.
2-hour rule	Done	The warehouse worker sees the route's services tagged "Suggested", "Within window" or "Risk > 2 h". Order ot_00006.
Service timetable	Done	Each operator carries its own timetable (origin, destination, departures). Seen under Coordinator → Operators.
How a shipment connects to a bus	Partial	Manual with a suggestion, as decided. The suggestion uses the browser's clock.
Postal code / province	Partial	Optional postal code on warehouses. Grouping by postal code in the panels is still missing.
MPO / batch	Partial	Optional field on the order plus a compliance KPI. MPO still needs to be defined with the consultant.
Promised time	Partial	A single 48 h value in config. Missing per route and per service.
Fleet costs	Partial	Daily cost per vehicle (demo data) feeding the cost-per-package KPI.
Dispatcher: fleet and active/inactive	Partial	Fleet and its cost come from Konnect; the active/inactive toggle is missing.
Vehicle GPS	Open	Integration pending on the business side.
QR/DataMatrix labels, real printer	Partial	Code 39 and a simulated portable printer.
Control Tower	Done	Coordinator → Control Tower: 9 KPIs, at-risk orders and incidents.
Audit / Reconciliation	Done	New role: reconciliation per checkpoint and incident cases.
Finance	Done	New read-only role: shipments by client and period, CSV export, no prices.
Infrastructure	Partial	Inside the Coordinator: import operators and view their timetable and fleet. Editing the network is still missing.
Merchant and operator onboarding	Done	Coordinator → Merchants (registration and warehouses) and Operators (import from Konnect).
Flow diagram and scan nomenclature	Done	Sections 05 and 10 of this document.

05 The new flow

This is the diagram the consultant left blank. It used to be 8 states, jumping straight from "loaded on bus" to "delivered"; now it's 11.

SCAN = per-package scan (user + timestamp) · SIGN = signature from an authorized person, RUT visually verified · 10a = last mile with the operator · 10b = recipient pickup · bus unloading is not scanned · the merchant only sees 5 states (Created, Assigned, In pickup, In transit, Delivered).

BEFORE (8)	NOW (11)
created → assigned_to_operator → pickup_assigned → picked_up → in_operator_warehouse → transport_assigned → loaded_on_bus → delivered	created → assigned_to_operator → accepted → pickup_assigned → picked_up → in_operator_warehouse → transport_assigned → loaded_on_bus → in_destination_warehouse → (last_mile_assigned ready_for_pickup) → delivered

06 Changes by role

ROLE	BEFORE	NOW
Merchant	Create an order, view progress.	Same, plus an MPO field, a pickup-ready notice, a visible count difference, incidents and operational detail.
Coordinator / Control Tower	Assign to an operator.	Assigns while choosing the last mile ; sees KPIs and at-risk orders; registers merchants and their warehouses (KAM); imports operators from Konnect; resolves incidents.
Audit / Reconciliation	Didn't exist.	New , read-only: reconciliation per checkpoint, incident cases (can close them with a note).
Finance	Didn't exist.	New , read-only: shipments by client, operator and period; CSV; no prices.
Dispatcher	Assign driver and vehicle.	Accepts or rejects the assignment; assigns pickup; assigns the last mile when applicable.
Pickup driver	Scan and sign.	Also adjusts the package count (with a reason), marks "not picked up", reprints labels and reports incidents.
Warehouse worker	Scan inbound and assign a bus.	Bus with suggestion and 2 h window ; destination-warehouse inbound ; on pickup: marks ready and hands over with a scan and a signature.
Bus driver	Scan the load.	Same (unloading is still not scanned).
Delivery driver	Scan and sign at destination.	Now the last-mile driver, assigned by the dispatcher.

Naming: the "logistics operator" you mentioned is, in the system, the **Coordinator / Control Tower** (your team). The "transport operator" is the external company.

07 Data and rule changes

New data files

FILE	WHAT IT'S FOR
<code>konnnect.json</code>	Simulated catalog of Konnect operators (fleet, timetable, crew). Operators are imported from here.
<code>incidents.json</code>	Incidents: count, damage, missing, other; open or resolved, with an optional photo and a resolution note.
<code>config.json</code>	Business rules: promised hours (48) and the bus window (2).

New order fields

- **Count:** `bultos_declarados` (immutable), `bultos_total` (current), and `conteo` with the difference, reason, who and when.
- **Acceptance:** status (pending, accepted, rejected) and a list of rejections with their reason.
- **Transport:** service, departure, assignment time, load time, `riesgo_sla` and `ventana_ok`.
- **Last mile:** modality, driver, vehicle, pickup point and "ready" timestamp.
- **Destination warehouse:** inbound timestamp. Optional **MPO**. Warehouses with an optional postal code.

New rules the backend must enforce

RULE	DETAIL
Accept before assigning a driver	A driver can't be assigned until the dispatcher accepts. A rejection requires a reason and sends the order back to "created".
Count adjustment	Only during pickup, only by the assigned driver, always with a reason. An already-scanned package can't be removed. Every change leaves a count difference and opens an incident.
Mandatory signature	Pickup and final delivery aren't confirmed without an authorized person, a verified RUT and a signature. Confirmed once the active packages are scanned.
Bus	The service must cover the route and the departure must exist in the timetable. Departing more than 2 h after assignment is flagged as risk. Window compliance is measured at load time.
Last-mile modality	Chosen by the coordinator at assignment. With the operator: the dispatcher assigns a driver. Pickup: the warehouse worker marks "ready" and hands over with a scan and signature.
Incidents	Reported by the merchant and the crews; only the Coordinator and Audit can resolve them, with a note.
Onboarding	Only the Coordinator registers merchants (valid, unique RUT) and imports operators (one-time).
Read-only roles	Audit and Finance see all orders but can't modify operations.

08 Implemented KPIs

Shown under Coordinator → Control Tower (partly in Audit as well). All are computed from the event log's timestamps.

KPI	HOW IT'S COMPUTED IN THE MOCKUP	NOTE
SSP	Orders with pickup completed ÷ orders that ever had an operator.	Over the full period, not per day.
Acceptance	Orders accepted ÷ assignments (orders with an operator + recorded rejections).	A rejection counts as an assignment.
PTAT	Average of (operator-warehouse inbound - operator assignment), in hours.	Only orders that already arrived.
Pickup adherence	Σ packages picked up ÷ Σ packages declared.	Above 100% = extra packages; below 100% = missing ones.
Successful inbound	Origin-warehouse inbound scans ÷ packages picked up.	Anti-theft in transit.
Service level	Deliveries with $R \leq 1$ ÷ deliveries; $R = (\text{delivery} - \text{creation}) \div 48 \text{ h}$.	We use $R \leq 1$. Average R is also shown.
Bus window	Orders loaded within 2 h of assignment ÷ orders loaded.	Our own KPI for the 2 h decision.
MPO compliance	Batches with all their orders delivered ÷ batches with any order picked up.	Depends on defining MPO.
Cost per package	Daily cost of the vehicles used in pickups ÷ packages picked up.	Framed as cost ÷ shipments (fixes the consultant's error). Demo costs.

Merchants

Operators

Coordinator / Control Tower

Control Tower

SSP - Successful pickups

67%

Orders picked up ÷ assigned - 6/9

Acceptance rate

78%

Accepted by the dispatcher ÷ assignments - 7/9

PTAT - Pickup turnaround

1.7 h

Assignment → warehouse intake (average)

Pickup adherence

107%

Packages picked up ÷ declared - 16/15

Successful inbound

100%

Inbound scans ÷ picked up (anti-theft) - 16/16

Service level

100%

Deliveries with $R \leq 1$ ($R = \text{actual} \div \text{promised time}$) - 0.24

Bus window

100%

Loaded within 2 h of assignment - 4/4

MPO compliance

67%

Lots delivered ÷ lots picked up - 2/3

Cost per package (pickup)

\$9,063

Fleet cost used ÷ packages (demo)

Orders at risk 1

OT-00004

⚠ 2 h window expired without loading

Control Tower

Indicators computed from the timestamps of the event log. Formulas follow the consultant document; promised times and costs are demo values.

Incidents 1

ORDER	TYPE	STATUS	DETAIL	CREATED	
OT-00006	Damage	Open	Una caja llegó con el embalaje dañado; se registra al ingresar a bodega.	21/09/2026, 12:06	Resolve
OT-00001	Count variance	Resolved	El merchant entregó una caja extra que no estaba declarada (3 → 4) ✓ Merchant confirma la caja adicional. Se corrige el conteo declarado.	20/09/2026, 07:31	

Control Tower: KPIs, at-risk orders (2 h window overdue) and incidents.

09 Differences from the consultant (to communicate to him)

TOPIC	THE CONSULTANT	US
Who prints the labels	The driver prints them at pickup with a portable printer.	The merchant prints and affixes the labels beforehand. The driver only prints new labels if the count changes, and can reprint.
Count change	The driver edits the count.	Same, but always with a reason ; leaves a count difference and an incident.
Identity verification	Merchant's signature.	Also: at least 2 authorized people with a RUT , visually checked against their ID, and a signature at final delivery .
Last mile	Open (operator, pickup or third parties).	Operator or pickup; third parties out.
Scan on bus unload	None.	None; the control point is the destination-warehouse inbound scan.
Formulas	CPS inverted; $R < 1$ and $R \leq 1$.	$CPS = \text{cost} \div \text{packages}$; $R \leq 1$.

10 Scan nomenclature (proposed)

This is the table the consultant left blank. Every scan records the piece, the user, and the date/time.

SCAN	INTERNAL CODE	WHO	WHERE	SIGNATURE
Pickup	recoleccion	Pickup driver	Merchant's warehouse	Yes
Origin-warehouse inbound	ingreso_bodega_op	Warehouse worker	Operator's warehouse (origin)	No
Loaded on bus	carga_bus	Bus driver or aide	Terminal / origin warehouse	No
Destination-warehouse inbound	ingreso_bodega_destino	Warehouse worker	Operator's warehouse (destination)	No
Delivery	entrega	Last-mile driver (or warehouse worker, for pickup)	Destination warehouse or pickup point	Yes

Not scanned (out of scope): bus unloading, staging and warehouse outbound.

Label code

- Format: KARGO-<5-digit order>-<3-digit package>, e.g. KARGO-00007-002.
- The label also shows the human count "**i/n**" (e.g. 2/4) to catch missing boxes.
- Packages added during pickup continue the numbering (e.g. 005) and are marked "Added".
- The barcode is Code 39 today; the consultant's target is QR or DataMatrix.

The screenshot displays the KARGO mockup interface. At the top, there's a header with the KARGO logo, a user profile for 'Carla Mendoza (Falabella)', and language options (ES, EN). A sidebar on the left contains navigation links: 'Panel', 'Órdenes', 'Nueva encomienda', and 'Cuenta'. The main content area shows the 'Merchant' section for 'OT-00007'. It includes a 'Volver' button, a '+ Nueva encomienda' button, and an 'Imprimir' button. Below this, a note states: 'Un código por bulto. Se escanea en cada traspaso (Code 39; en el sistema real, QR/Code128 generado por el backend)'. Four labels are displayed, each with a barcode and the following information: 'KARGO-00007-001', 'KARGO-00007-002', 'KARGO-00007-003', and 'KARGO-00007-004'. Each label also shows the origin 'CD Pudahuel -> CD Temuco', the address 'Manuel Montt 452, Temuco', and the weight 'Ropa - 3 kg · MPO-771'.

Labels for order ot_00007: one code per package with "i/n".

11 Open items and next steps

TOPIC	WHO DECIDES	NOTE
Billing and pricing	Business	On hold; Finance already delivers the data needed for invoicing.
Third parties in the last mile	Business	Who pays and how it's integrated.
Real vehicle GPS	Konnect integration	Only a schematic map today.
MPO definition and batch-reconciliation rules	Consultant	We assumed "master purchase order".
Promised time per route and service	Consultant + business	A single 48 h value today.
Failed or rescheduled delivery	Business	Assumed rare, but a minimal state is worth having.
Scan on bus unload	Consultant	Revisit as volume grows.
Dispatcher active/inactive toggle and network editing	Product	Still missing in the Infrastructure section.
QR/DataMatrix and a real portable printer	Backend and hardware	Simulated in the mockup.

Suggested next steps

1. Send the consultant the corrections to his document and the "winery" clarification.
2. Validate the flow diagram (section 05) and the scan nomenclature (section 10) with him.
3. Decide how to handle failed delivery and promised time per route.
4. Hand the backend team the repository: `web/store.js` is the executable spec and `web/data/*.json` is the data contract.

12 Verification

- **17 automated tests** pass: full chain with both modalities, permissions, count adjustment, bus window, incidents, onboarding, KPIs, reconciliation, finance, and translation coverage (every key, error and event exists in both Spanish and English).
- The full flow was walked through the interface (merchant → coordinator → dispatcher with reject and reassign → pickup with adjustment → bus with risk → destination → pickup with signature) with no console errors.
- Code published at github.com/ref0612/kargo_final, branch main, commit 7a0e3eb.

Detailed guide to every screen and button: the "Complete mockup guide" document.
